## PERSONAL SKILLS

Mother tongue	Italian
Other language	English
Technical skills and competences	Ability to plan and complete a project. Ability to autonomously organize work, setting priorities and taking responsibilities. Familiarity with laboratory procedures, equipment, and protocols. Skills in several techniques to analyze cell viability, proliferation, cell death, cell cycle, chemoresistance, autophagy and senescence (MTT, SRB assay, BrdU incorporation assay, Cell Cycle, PI/ Annexin-V, DNA Ladder), ROS assay, Calcein assay, Ca <sup>2+</sup> influx; flow cytometry, confocal microscope, Elisa, Western Blot, immunocytochemistry, immunohistochemistry; Real Time PCR, Droplet Digital PCR, cloning, gene silencing, DNA transfection, mutagenesis. Models: cancer and normal cell lines, stem cells, biopsies, bone marrow aspirated, peripheral blood to isolate single cancer cells. Excellent knowledge of data analysis programs and statistical analysis tools (CellQuest, Cyflogic, WinMDI, FlowJo, GraphPad, MedCalc).
Computer skills	Excellent knowledge of operating systems (Windows, MacOS), biological databases (cBioPortal, GenomeNet) and bioinformatics tools (Graphpad Prism software, MatLab).

## SCIENTIFIC INTERESTS

My research regards mainly the oncologic field. In particular, it focuses on the role of Transient Receptor Potential channels in cancer progression and on the role of tyrosine kinase inhibitors as new therapeutic strategy for cancer treatment.

**Brain Cancer**

- Role of Transient Receptor Potential Vanilloid (TRPV) receptors in human glioma. This research is focused on the role of TRPV channels in regulating viability, chemoresistance and differentiation in different human cell lines and tissues. The models used in this research are: human glioma U87MG, T98 and U251 cell lines, glioma cancer stem cells, glioma biopsies.
- Role of cannabidiol as TRPV2 agonist in regulating human glioma cell viability and chemosensitivity to standard therapy.
- Effects of the tyrosine kinase inhibitor axitinib on human glioma cell viability
- Role of mucolipin-2 (TRPML-2) channel in human glioma cell viability. The models used in this research are: U87MG, T98 and U251 cell lines, glioma biopsies, normal brain, normal astrocyte, neural stem/progenitor cells.
- Role of mucolipin-1 (TRPML-1) channel in the autophagic pathway. The models used in this research are: U87MG, T98 and U251 cell lines.

**Bladder Cancer**

- Role of TRPV channels and their ligands in regulating cell viability and cell death in human bladder cancer cells. In this project the human models used are: bladder cancer cells (RT4, J82, 5637, T24), biopsies.
- The mechanisms responsible of the tyrosine kinase inhibitors (sorafenib, sunitinib and pazopanib) anti-tumor effects in human bladder cancer cell lines (5637, J82, T24).
- Role of autophagic pathway activation after Capsaicin treatment and the induction of epithelial-mesenchymal transition in T24 and 5637 bladder cancer cell lines.
- Potential detection of a specific metastatic gene expression associated with high ability in bladder cancer patient-derived circulating tumor cells.

**Renal cell carcinoma**

- Effects of the tyrosine kinase inhibitor axitinib used as first line therapy or as second line in a sequential therapy after sunitinib treatment in human renal carcinoma cell lines (A-498 and Caki-2).
- The ability of sunitinib and axitinib to modulate the DNAM-1 and NKG2D ligands to study an hypothetical immunosurveillance mechanism toward treated cancer cells.

**Multiple Myeloma**

- Expression of TRPV2 channels in CD138+ plasma cells isolated from primary diagnosed patients with multiple myeloma.
- Role of TRPV2 activation by cannabidiol on multiple myeloma cell lines (RPMI8226 and U266).
- The effect of cannabidiol treatment alone and in combination with bortezomib on multiple myeloma cell lines.
- The effect of THC and cannabidiol in combination with the novel proteasome inhibitor on multiple myeloma cell lines.

**Prostate Cancer**

- Expression of adrenergic receptor type A (ADRA) and the role of their synthetic antagonists in inducing cell death in human prostate cancer cell (PC3).
- Cross-talk between  $\alpha_{1D}$ -AR and TRPV1 receptors and the role in controlling the NA-induced proliferation of prostate cancer cells.

**Breast cancer**

- Role of N-Methyl-d-aspartate (NMDA) Receptor Antagonists on breast cancer cells. In this project the human models used are: MCF-7 and SKBR3 cell lines.

**Lung**

- Effect of thyme extract in human normal bronchial and tracheal epithelial cell lines and in human H460 lung cancer cell line

**Ovary**

- Characterize the PACAP/VIP/receptor system in the mouse ovary.
- Expression of PACAP and PACAP/VIP receptors in human granulosa-luteal cells obtained from consenting *in vitro* fertilization patients attending a private fertility clinic and assessed a possible anti-apoptotic effect of these molecules. Research in collaboration with Technobios Procreazione (Bologna).
- Effects of recombinant LH administration, during late follicular development stages, in recombinant FSH stimulated cycles on follicular fluid parameters and on cumulus cell quality.

**Pancreatic cancer**

- Identify the differences in terms of circulating tumor cells (CTCs) and gene expression profile among patients with different clinical outcome of pancreatic ductal adenocarcinoma. CTCs could be potential biomarkers useful to define new treatment strategies.

**Muscular-skeletal apparatus**

- Effect of natural extracts in normal human osteoblast and myoblast cell lines.
